

I wanted to make the school website more accessible for those who are dyslexic or have ADHD. The first amendment was to change the background colour to an off white colour. It looks like a newspaper. I had the idea to apply a button to divert the website from how it is to dyslexic and ADHD friendly, but that required JavaScript, and I found it difficult. Despite all of that, I still used it in the code. I was unsure whether it was meant to cover all the pages or not, so I've done some. I have removed some of the institutes and left ICA (Institute of Creative Arts) only. The rest are just placeholders or empty links (mostly placeholders). There was a problem with the drop-down menu, where it wasn't working properly, so I had to target the div code so it could work properly. By far the hardest part was trying to do the image carousel since I wanted to mimic the school's website. Some of the codes that I found online were not helpful. Either I've written something wrong, or the code is clashing with others. Successfully, I managed to fix the problem; it was some writing mistakes. I was also unsure about whether we were meant to copy word for word, so I copied parts of the website. There is a part of the website where I could have made it more organised for me. In my opinion, the way it looks was crazy, but a few links are much better. I could have organised them in sections, for example, having all of the digital art parts underneath each other. I think what I have done in this website is that the style of the buttons is more cool, they glow and are more eye-catching. An example of this is if you go to applications on the home page and click it, you will see in one of the forms, there is a button within the sentences. I successfully experimented with a glow button to be used as an indicator for applications and others. The script I had changed to Comic Sans/Arial is more readable.
